The Just Culture Principles in Aviation Law  
 Francesca Pellegrino 2019-09-09 This book reviews and critically analyzes the current legal framework with regard to a more just culture for the aviation sector. This new culture is intended to protect front-line operators, in particular controllers and pilots, from legal action (except in the case of willful misconduct or gross negligence) by creating suitable laws, regulations and standards. In this regard, it is essential to have an environment in which all incidents are reported, moving away from fears of criminalization. The approach taken until now has been to seek out human errors and identify the individuals responsible. This punitive approach does not solve the problem because

frequently the system itself is (also) at fault. Introducing the framework of a just culture could ensure balanced accountability for both individuals and complex organizations responsible for improving safety. Both aviation safety and justice administration would benefit from this carefully established equilibrium.

### **Routledge Handbook of Public Aviation Law**

Paul Stephen Dempsey 2016-07-15 The

Routledge Handbook of Public Aviation Law is the first book to incorporate a comprehensive analysis of Public Aviation Law - principally international, but also domestic law in a comparative context - in a single volume. International Law is pervasive in Aviation Law, and is incorporated into a number of major multilateral treaties (e.g., the Chicago Convention of 1944, for Public International Air Law). This is supplemented by various Annexes (promulgated by the International Civil Aviation Organization) and Conventions and Protocols (promulgated by States in diplomatic conferences). States then implement these international obligations in domestic laws that create aviation regulatory administrations that, in turn, promulgate regulations. Bringing

together leading scholars in the field, this prestigious reference work provides a comprehensive and comparative overview of Public Aviation Law. It surveys the state of the discipline including contemporary and emerging areas of law, regulation, and public policy in air transportation. Each chapter begins with an overview of the international law applicable to the subject matter, followed, where appropriate, by a comparative examination of domestic statutes, regulations, and jurisprudence. The objective of the book is to identify and summarize existing areas within the context of international research, and to identify and highlight emerging areas. Both practical and theoretical in scope, the Routledge Handbook of Public Aviation Law will be of great relevance to scholars, researchers, lawyers, and policy makers with an interest in aviation law.

**Air Traffic Management** Marina Efthymiou  
2023-05-10 This book addresses each of the Air Navigation Services' five broad categories of services provided to air traffic during all phases of operation: air traffic management (ATM), communication, navigation and surveillance services (CNS), meteorological services for air navigation (MET), aeronautical information services (AIS) and search and rescue (SAR). This book is designed for working professionals in Air Transport Management, but also undergraduate and postgraduate students studying air transport management and aeronautical engineering. It will also be very helpful for the training of air traffic control officers (ATCOs). The book does not require any prior (specialist) knowledge as it is an introduction to air navigation service provider (ANSP) business. There is very little literature available that gives a detailed appreciation of the complexities, potential risks and issues associated with the provision of air navigation services. The role of

this book is to fill this significant gap with a comprehensive, in-depth study of the management principles related to ANSPs. This is particularly timely given recent ATC developments in Europe, USA and New Zealand. Airlines and airports rely on the ANSPs for the management of air traffic. Hence, air navigation services (ANS) provision is considered as a core element for air transportation.

**Automation and Systems Issues in Air Traffic Control** John A. Wise 2012-12-06

In recent years, increases in the amount and changes in the distribution of air traffic have been very dramatic and are continuing. The need for changes in the current air traffic systems is equally clear. While automation is generally accepted as a method of improving system safety and performance, high levels of automation in complex human-machine systems can have a negative effect on total system performance and have been identified as

contributing factors in many accidents and failures. Those responsible for designing the advanced air traffic control systems to be implemented throughout the alliance during the next decade need to be aware of recent progress concerning the most effective application of automation and artificial intelligence in human-computer systems. This volume gives the proceedings of the NATO Advanced Study Institute held in Maratea, Italy, June 18-29, 1990, at which these issues were discussed.

Cross-border Provision of Air Navigation Services with Specific Reference to Europe Niels Van Antwerpen 2008-01-01 The tremendous flow of air traffic traversing the airspace of the European Union demands extraordinary vigilance on the part of air navigation service providers. Although the first requirement of air navigation services is obviously the enhancement of safety, providers must also attend to the efficiency and optimisation of airspace capacity and the minimisation of air

traffic delays. As technological and operational improvements proceed in these areas, jurisdictional issues of responsibility and liability--particularly in cases of mid-air collisions--become ever sharper and more in need of precise definition. This detailed and insightful exposition focuses on these issues from three overlapping perspectives: the international and European legal framework dealing with air navigation services, the question of state responsibility, and the question of liability for damage inflicted by air navigation service providers. The author's in-depth analysis includes examination of many elements, among them the following: \* the interrelated roles of the International Civil Aviation Organization (ICAO), the European Civil Aviation Conference (ECAC), the European Organisation for the Safety of Air Navigation (EUROCONTROL), the European Community's European Aviation Safety Agency (EASA), and other international bodies; \* the Single European Sky initiative, its

establishment of Functional Airspace Blocks (FUAs), and its ongoing research program (SESAR); \* establishment of transparent lines of state responsibility in the context of cross-border provision of air navigation services; and prospects for the imposition of a transparent liability regime on corporatized air navigation service providers. In conclusion, the author enumerates the essential elements required for cross-border provision of air navigation services and offers well-thought-out final recommendations and conclusions on the most preferable way to pursue such cross-border provision within and outside the European Community. A model agreement for the delegation of air navigation service provision appears as an appendix. All professionals concerned with air navigation, in Europe and elsewhere, will appreciate the depth of knowledge and commitment apparent in this book. The deeply informed insights manifest in its pages will be of enormous value to aviation

agency officials and air law practitioners everywhere.

book gathers the chapters of Cognitive InfoCommunication research relevant to a variety of application areas, including data visualization, emotion expression, brain-computer interfaces or speech technologies. It provides an overview of the kind of cognitive capabilities that are being analyzed and developed. Based on this common ground, it may become possible to see new opportunities for synergy among disciplines that were heretofore viewed as being separate. Cognitive InfoCommunication begins by modeling human cognitive states and aptitudes in order to better understand what the user of a system is capable of comprehending and doing. The patterns of exploration and the specific tools that are described can certainly be of interest and of great relevance for all researchers who focus on modeling human states and aptitudes. This innovative research area provides answers to the latest challenges in influence of cognitive states and aptitudes in order to facilitate learning or

generally improve performance in certain cognitive tasks such as decision making. Some capabilities are purely human, while others are purely artificial, but in general this distinction is rarely clear-cut. Therefore, when discussing new human cognitive capabilities, the technological background which makes them possible cannot be neglected, and indeed often plays a central role. This book highlights the synergy between various fields that are perfectly fit under the umbrella of CogInfoCom and contribute to understanding and developing new, human-artificial intelligence hybrid capabilities. These, merged capabilities are currently appearing, and the importance of the role they play in everyday life are unique to the cognitive entity generation that is currently growing up.

and controlling their behavior and operation. These sensors often differ significantly from those designed for applications in automobile, ship, railway, and other forms of transportation, and those used in industrial, chemical, medical, and other areas. This book offers insight into an appropriate selection of these sensors and describes their principles of operation, design, and achievable performance along with particulars of their construction. Drawn from the activities of the International Federation of Automatic Control (IFAC), especially its Aerospace Technical Committee, the book provides details on the majority of sensors for aircraft and many for spacecraft, satellites, and space probes. It is written by an international team of twelve authors representing four countries from Eastern and Western Europe and North America, all with considerable experience in aerospace sensor and systems design. Highlights include: • coverage of aerospace vehicle classification, specific design criteria,

and the requirements of onboard systems and sensors; • reviews of airborne flight parameter sensors, weather sensors and collision avoidance devices; • discussions on the important role of inertial navigation systems (INS) and separate gyroscopic sensors for aerospace vehicle navigation and motion control; • descriptions of engine parameter information collection systems, including fuel quantity and consumption sensors, pressure pick-ups, tachometers, vibration control, and temperature sensors; and • descriptions and examples of sensor integration.

development of resilience engineering has focused on four abilities that are essential for resilience. These are the ability a) to respond to what happens, b) to monitor critical developments, c) to anticipate future threats and opportunities, and d) to learn from past experience - successes as well as failures. Working with the four abilities provides a structured way of analysing problems and issues, as well as of proposing practical solutions (concepts, tools, and methods). This book is divided into four main sections which describe issues relating to each of the four abilities. The chapters in each section emphasise practical ways of engineering resilience and feature case studies and real applications. The text is written to be easily accessible for readers who are more interested in solutions than in research, but will also be of interest to the latter group.
